Template Manual

Seppo HTML - Demo 6

Thank You :)

Thanks for purchasing the template and for supporting our work. Seppo is our new fancy template. Responsive, clean and professional look with sleek design will satisfy all your needs.

You will need basic HTML, CSS, jQuery skills to edit Seppo HTML. We will try to help you out with this documentation. If we fail here, you can always contact us on https://cocobasic.ticksy.com/ and our developers will try to solve your issue.

How To Install?

Considering that Seppo is HTML template, with fully functional email/subscribe notification mechanism for sending messages via contact form, all you need to do is to upload all template files via your FTP account to your web server (for uploading files you can use FTP client like **FileZilla**) and just to modify code in **config.php** file. To edit the **config.php** you can use any text editor (for example **NotePad++**)

These are parameters that you need to modify:

- Your email addresses where you want to receive emails filled with information from the subscribe form.

In **config.php** file, you will see this pattern:

```php
$email = "yourmail@here.com";   //<-- Your email
```

You need to modify only the value on the right side.

Do not remove any quote or double quote signs while doing this.

Also, there are some more strings which you can change:

```php
$emailSubject = "New Subscriber from Seppo";

$emailText = "New Subscriber: ";

$successfulAlert = "Thank you for subscribing!";
```

Folder Structure

TEMPLATE

|

|--- **css**

| |--- **style.css**

|

|--- **images**

| |--- all demo images

|

|--- **js**

| |--- all js files

|

|--- **php**

| |--- sendMail.php

|

|--- **index.html**

|

|--- **config.php**

Which file to edit?

Of course, you can edit any of the files from above (if you know what you are doing) also you can add (include) some additional JS/CSS files for some additional features, but if your skills are limited and you want just to replace the demo/dummy content with your own, you need:

- To edit **.html** files (using some text editor, for example **NotePad++**) and to change the demo content (text) with your own

- If you don't need some part from our demo content, I am suggesting to use comments tags in html files to disable that part. More about HTML comments tags - https://html.com/tags/comment-tag/

- To override the images from **images** folder with your own

- Change the main **style.css** file to set your own colors, font size, etc…

- Edit **config.php** file and set your own mail address

HTML Structure

Seppo (Demo 6) consist only one HTML file **index.html**

To edit the **html** file you can use any text editor (for example **NotePad++**).

Index.html structure

In index.html file on the start is a **head** tag which looks like this:

```
<head>

<title>Seppo - Demo 6</title>

<meta charset="UTF-8">

<meta http-equiv="X-UA-Compatible" content="IE=edge">

<meta name="description" content="Template by CocoBasic">

<meta name="keywords" content="HTML, CSS, JavaScript, PHP">

<meta name="author" content="CocoBasic">

<meta name="viewport" content="width=device-width, initial-scale=1.0">

<link rel="shortcut icon" href="images/favicon.ico">

<link
href="https://fonts.googleapis.com/css2?family=Montserrat:wght@400;500;600;700&family=Playfair+Display:wght@400;600&display=swap" rel="stylesheet" >

<link rel="stylesheet" href="css/style.css" >

</head>
```

Here you need to set your own **title, description, keywords** and **author.** Also, don't forget to create your own **favicon** and to replace the default one (it is placed in the images folder). If you need to change/add Google fonts, you need to edit this line:

```
<link
href="https://fonts.googleapis.com/css2?family=Montserrat:wght@400;500;600;700&family=Playfair+Display:wght@400;600&display=swap" rel="stylesheet" >
```

One of the main feature of Demo 6 is a countdown timer which you can set changing this line of code:

```
<span class="count-down" id="count-down" data-end="2024, 7, 30">000D / 00H / 00M / 00S</span>
```

Set your own end date in format **Year**, **Month**, **Day**.

At the end of the index.html file, there is a part of the code where we are including all **JavaScripts** files which we are using in our template. This part looks like this:

```
<!--Load JavaScript-->

    <script src="js/jquery.js"></script>

    <script src='js/main.js'></script>
```

Source & Credits

Special thanks to creators and contributors of these awesome libraries, we couldn't have done this without them.
